

TFBS enrichment across concordant RNA-ATAC gene sets

Gene sets correspond to the Unstimulated cell-type and sex strata in Figure 2D; individual TF motifs are shown separately.

Dots show covariate-adjusted motif overrepresentation across each gene set's promoters and linked ATAC peaks. Dot size uses the largest global BH FDR across 64 support configurations; black rings mark FDR <= 0.05 with odds ratio > 1 in every configuration. Counts beneath column labels are target genes / foreground regulatory regions. Closely related IRF motifs cannot identify the exact bound IRF protein. Female and Male columns use different selected genes and are not a formal sex contrast.
