

TFBS enrichment across concordant RNA-ATAC gene sets

Threshold-robust individual motifs plus selected representatives of AP-1/NF-kB, BACH, RUNX, CTCF, FOX, and HIF programs

Black rings identify adjusted OR > 1 and global BH FDR <= 0.05 in all 64 support configurations; dot size uses the largest FDR across configurations. Motifs in the grey context block were selected and are shown even when not significant; they provide context, not positive evidence. Counts at right are target genes / foreground regulatory regions. Closely related IRF motifs cannot identify the exact bound IRF protein.
